

Homework 1, due September 5th, 11:59pm

August 28, 2018

Use a programming language or package where decision trees can be trained and applied. Examples include Matlab, Python (scikit-learn or xgboost package), or R.

1. Using the training and test sets specified in the syllabus, perform the following tasks:

- a) On the `madelon` dataset, train decision trees of maximum depth 1, 2, ..., up to 12, for a total of 12 decision trees. If your package does not allow the max depth as a parameter, train trees with $2^1, 2^2, \dots, 2^{12}$ maximum splits, again a total of 12 trees. Use the trained trees to predict the class labels on the training and test sets, and obtain the training and test misclassification errors. Plot on the same graph the training and test misclassification errors vs tree depth (or log2 of max splits) as two separate curves. Report in a table the minimum test error and the tree depth (max splits) for which the minimum was attained. (4 points)
- b) Repeat point a) on the `wilt` dataset, with maximum tree depths d from 1 to 10 (max splits $2^1, \dots, 2^{10}$). (2 points)
- c) Repeat point a) on the `gisette` dataset, with maximum tree depths d from 1 to 6 (max splits $2^1, \dots, 2^6$). (2 points)
